

WEAK PROMPT:

you are a hr in a tech company what type of questions you ask in a tech interview

If I were an HR or technical interviewer in a tech company, I would ask a mix of **technical, problem-solving, project, and behavioral questions**. The questions depend on the role (Software Developer, AI/ML Engineer, Data Scientist, DevOps Engineer, etc.).

Since you've been working on **YOLOv8, AI/ML, Docker, FastAPI, and MLOps**, here are questions I would ask you.

1. Tell Me About Yourself

- Introduce yourself.
- What projects have you worked on recently?
- Why are you interested in AI/ML?

What I'm looking for: Communication skills and confidence.

2. Project-Based Questions

About Your Stray Animal Detection Project

- Explain your project architecture.

4. Computer Vision Questions

- What is object detection?
- Difference between object detection and segmentation?
- Explain IoU (Intersection over Union).
- What is Non-Maximum Suppression (NMS)?
- Why is NMS important?
- Explain confidence score.
- What is transfer learning?

5. YOLO Questions

These are very common.

- What does YOLO stand for?
- Why is YOLO faster than R-CNN?
- Explain YOLO architecture.
- Difference between YOLOv8n and YOLOv8m.
- Which model did you use and why?
- How do you export YOLO models?
- What formats can YOLO models be exported to?

Expected answer:

STRONG PROMPT

you are a 10 years experienced technical HR what type of questions you ask in a technical interview

If I were a **Technical HR with 10 years of experience**, I would not focus only on theory. I would try to understand:

1. Can you solve problems?
2. Do you really understand your project?
3. Can you learn quickly?
4. Can you work in a team?
5. Can you communicate technical ideas clearly?

For a fresher or junior AI/ML candidate, my interview might look like this:

Round 1: Introduction

Q1. Tell me about yourself.

What I check:

- Confidence
- Communication
- Structure

Round 3: Project Ownership

Let's take your Stray Animal Detection project.

Q3. Why did you choose YOLOv8?

Q4. Why not Faster R-CNN?

Q5. Why not SSD?

Q6. Why YOLOv8m instead of YOLOv8n?

Q7. How many images were used?

Q8. How were they labeled?

Q9. What augmentation techniques were used?

Q10. What accuracy did you achieve?

Q11. How do you know your model is good?

Q12. What metrics did you use?

WEAK PROMPT

you are a ml engineer and your project "AI powerd women monitoring system" and you need to do it

If I were an ML Engineer and my project was "**AI-Powered Women Monitoring System**", I would first clearly define the problem because "monitoring women" can mean many things. A responsible and practical version would be a **Women's Safety Monitoring System** that detects emergencies and sends alerts, rather than continuously surveilling people.

Project Title

AI-Powered Women's Safety Monitoring System

Problem Statement

Women may face situations such as:

- Harassment
- Chain snatching
- Stalking
- Physical assault
- Medical emergencies

The goal is to automatically detect suspicious situations and alert guardians or authorities in real time.

Input Sources

- CCTV cameras
- Mobile phone camera
- Body-worn camera
- Smart wearable device

AI Components

1. Person Detection

Model:

- YOLOv8

Detect:

- Woman
- Man
- Vehicle
- Motorcycle

2. Suspicious Activity Detection

Detect events such as:

- Chain snatching
- Bag snatching

STRONG PROMPT

you are a 10 years experienced ml engineer and your project "AI powered women monitoring system" and you need to do it

If I were a 10-year experienced ML Engineer and my company assigned me "AI-Powered Women's Safety Monitoring System", I would approach it like a real production system, not just a college project.

Step 1: Define the Actual Problem

The first mistake many teams make is saying "monitor women." That's too broad and raises privacy concerns.

Instead, I would define the goal as:

"Detect potential safety threats and emergency situations involving women in public spaces and generate real-time alerts."

Features I Would Build

Module 1: Emergency Activity Detection

Detect:

- Chain snatching
- Bag snatching

Scenario:

A person continuously follows a woman.

Logic:

1. Detect all persons.
2. Track IDs.
3. Measure distance between tracked individuals.
4. Analyze behavior over time.

Example:

Person 12 follows Woman 4

Distance < 3 meters

Duration > 120 seconds

Alert Triggered

Module 3: Distress Detection

Audio Analysis

Detect:
