

AI-Based Women Safety Monitoring System

PROBLEM STATEMENT

Ensuring the safety of women in public and semi-public spaces has become a significant societal concern due to the increasing number of harassment, assault, and violence incidents. Traditional safety mechanisms such as CCTV surveillance and manual monitoring are often reactive, inefficient, and unable to provide real-time intervention during critical situations.

Existing systems lack the capability to automatically analyze suspicious activities or detect distress signals such as violence, abnormal human behavior, or emergency sounds like screams. As a result, timely alerts to authorities or nearby individuals are often delayed, reducing the chances of preventing harmful incidents.

To address these challenges, there is a need for an intelligent, automated system that can continuously monitor environments and proactively identify potential threats. The proposed system aims to develop an AI-based Women Safety Analytics System that utilizes video and audio data to detect unusual activities, violent behavior, and distress signals in real time. By leveraging Machine Learning and Deep Learning techniques, the system will analyze surveillance video feeds and environmental audio inputs to identify danger scenarios and generate immediate alerts.

The system is expected to improve response time, enhance situational awareness, and provide a reliable technological solution for ensuring women's safety in public spaces such as streets, transportation hubs, campuses, and workplaces.
